• Specimen Test

Specimen Printing Conditions	
Subjects	Data
Nozzle Temperature	245 °C
Bed Temperature	55 °C
Printing Speed	150 mm/s
Infill Density	100%
<i>All the specimens were annealed and dried at 50 °C for 8 h before testing. And the suggested annealing temperature of models printed with Bambu PLA Tough+ is 50 to 60 °C, and the time is 6 to 12 hours. The annealing effect depends on the annealing temperature, time and the model itself: size, structure, infill and other printing settings; some prints may deform and warp after annealing. When drying the filament and annealing the prints, it's required to use an oven that has big enough inside volume and can provides even temperature distribution, such as a blast drying oven (forced-air drying oven), and the filament and prints need to be away from the heater, and a micro-wave oven or kitchen oven is not compatible, otherwise the filament and prints can get damaged.</i>
